

## Type boolean

The values of primitive type boolean are **true** and **false**. The operators are:

**!** (meaning negation, of complement. **!true** is **false** and **!false** is **true**)

**&&** (and, or conjunction.  $b \ \&\& \ c$  is **true** iff both  $b$  and  $c$  are **true**; otherwise it is **false**)

**||** (or, or disjunction.  $b \ || \ c$  is **true** if  $b$  or  $c$  (or both) is **true**; otherwise it is **false**)

### Operator precedences

Operator **!** has highest precedence, then **&&**, and finally **||**. There is no universal tradition for the relative precedences of **&&** and **||**, and we recommend always using parentheses when they appear next to each other in an expression, as in

$(x < 5 \ \&\& \ y == 5) \ || \ z == 2$

### Short circuit evaluation

Operations  $b \ \&\& \ c$  and  $b \ || \ c$  are evaluated left-to-right using *short-circuit evaluation*. That means that as soon as the answer is known, evaluation stops. There are two cases to explain:

<b>false</b> <b>&amp;&amp;</b> $c$	evaluation does <i>not evaluate</i> $c$ ; it simply yields the value <b>false</b>
<b>true</b> <b>  </b> $c$	evaluation <i>does not evaluate</i> $c$ ; it simply yields the value <b>true</b>

Short-circuit evaluation helps to shorten and simplify code. For example, the following expression is true iff  $j$  is not 0 and  $k / j$  is most 50; division by 0 does not occur if  $j$  is 0:

$j \ != \ 0 \ \&\& \ k / j \leq 50$

### Expressions with boolean values

Relational expressions  $d == e$ ,  $d != e$ ,  $d < e$ ,  $d \leq e$ ,  $d > e$ , and  $d \geq e$  all evaluate to a boolean value—either **true** or **false**—and can thus be used in boolean expressions.

### Operators & and |

Operators **&** and **|** can also be used but we recommend against their use as boolean operations. They are *bitwise* operations, and we do not discuss them. Short-circuit evaluation is not used for them.

### Comparison with other languages

Some languages, e.g. C, use integers as booleans; 0 represents **false** and any other integer represents **true**. This does not work in Java.
